## Item description

The 750-640 RTC Module provides the higher-level control system with the actual time.

The time is buffered and continues to run in the event of a power failure. When an external receiver is connected, the clock can be set using the time signal from DCF77, WWVB, or MSF.

By default, the module is set to receive DCF77 signals.

The receiver can be supplied directly via the module.

Connecting an external receiver to operate the RTC module is not absolutely necessary.

With its 32 channels, the integrated time switch clock function makes it easier for the control unit to process time-triggered actions.

The module also counts the power-on time of the 32 channels.

Function blocks for RTC-module 750 - 640

Subject to changes. Please also observe the further product documentation!

The "RTC\_640\_01.lib" library provides the user with the "RTC\_640", "RTC\_JOB\_MANAGER" and "WEEKDAY" function blocks. The "RTC\_640" function block provides the basic services of the RTC module. The "RTC\_JOB\_MANAGER" function block is based on the "RTC\_640" function block and provides all information of the module in a structure. This function block manages the different services of the module via a scheduler. The "WEEKDAY" function block uses a date to calculate the corresponding weekday.
